## LIMITING ACCESS TO SURFACE WATER

### LIVESTOCK BMP #4

**Description:**  
Manage livestock around bodies of water or streams through fencing, alternative water systems, limited access points and stream crossing to protect water quality.

**AWQA Minimum Requirements:**  
Carefully manage livestock around bodies of water or streams where their presence may seriously contribute to nonpoint source pollution. Adequate vegetative cover should be maintained on the land area affected by livestock along the stream edge. Livestock activities are acceptable in these areas. Fencing of these areas will not be required; however, the selection and management of vegetation must be sufficient to adequately control or significantly abate potential soil erosion and provide adequate filtering and uptake benefits from the affected areas. If vegetation is not capable of withstanding grazing pressure, then livestock should be excluded except at designated crossing areas and watering sites. Temporary fence

may be used to exclude livestock from zones that may be grazed temporarily while maintaining the effectiveness of the practice.

**Recommendations:**  
Select and manage vegetation to control soil erosion. Use vegetation to provide stormwater filtering and uptake benefits from the affected areas. Exclude livestock except at designated crossing areas and watering sites if vegetation is not capable of withstanding grazing pressure. Use temporary fence to exclude livestock for pasture recovery in riparian areas. Consider slopes and stream characteristics when choosing locations for stream crossings and access points.
